### Abstract

I hope this editorial will give a different perspective to the lack of information about how the COVID-19 virus continues to grow with increasing prevalence today. A study recently published in the journal Nature explained that the percentage of COVID-19 virus was transmitted by a bat species living in Wuhan as 96.

**Keywords:** COVID-19 Virus; Bats

### Introduction

In my editorial article in January, I noted that American lobsters were over-hungry due to the sudden change in environmental temperatures, resulting from research.

The new point of view here is that human beings, who live the same as the body reflex experienced by American lobsters, consume more existing food stocks. Why is the COVID 19 virus spreading seriously, even though the information flow experienced during

the technological revolutions such as industry 4.0 in the age of the millennium was higher than the times when SARS and MERS epidemics were experienced? It is generally known that, with the fact that deaths occur in people who have a weak body and suffer from chronic diseases, most health problems also result from malnutrition. COVID in people with chronic diseases as well as deaths due to malnutrition (see publication [1]) of the virus epidemic caused by bat-outs, and the interventions made to endanger the populations of bats, which are in the critical duties of food that will be produced

by photosynthesis, with the reflection of solar energy to our World [2,3]. We see the reduction of the human population resulting in death with COVID 19. This issue is actually the fact that we are not alone in the world and when we plan to have a good time with a person we love and think about our career goals, when we plan to have a coffee in a cafe with our beloved, in fact, our peace of mind is unlike our social environment, our behavior towards the world we live in is different from the other part of the world. the situation we see in COVID 19. In this context, it would not be wrong to say that COVID 19 turned into a global threat, not just a regional epidemic. So what should be the solution?
