I prepared a transition article about the point where the first 4 publications I wrote about the proliferation of cancer cells [1-4]. Agenda Covid-19, however, is still fatal in cancer, like the Covid-19 virus. The most important reason for the preparation of this article is that a virus treatment and a cancer cell therapy should not be the same method. In fact, this is exactly the reason why it is called “mixing apple with pear” in our country. While a virus is directly related to the activation of a genetic code that enters the cell in the external environment, a cancer cell is the every body of any body cell (See figure 1). Understanding the behavior patterns of cancer cells directly determines the treatment method to be derived. What I want to say is that the virus vaccine prevents harm, but the cancer vaccine does not benefit a cancer cell that is not a virus. Again, in our country, the word to keep the ear elsewhere is said for this purpose. We can draw the following conclusion from my first 4 cancer articles. My first 3 articles are that a cancer cell multiplies and reaches a certain number. In my 4th article, the cancer cell has now opened the glass of riot. That means it will apply the same proliferation strategy in the new cell population. While doing this, it consumes a lot of energy. As long as this situation continues, we can say that a certain algorithm is formed with a proliferation. More than one cancer cell defends its righteousness like the first cancer cell (he eats, I’ll eat it too) and consumes more energy than necessary and reduces the body’s immunity as a result of not spending the energy entering the body regularly. In my following article, I aimed to create a result methodology by explaining this formation. I hope a correct treatment method for cancer can be determined.

Figure 1: a) Left is a cancer cell (the body itself) [5], b) right is a covid-19 virus (comes from out of the body) [6].
