Strategies are needed when we are on the path for determining our right choices for future. Future is based on the events and decisions that one take in the present. Our thoughts, actions even are decisions are based on our interest. Let's say for instance, if I am looking for the cyber security or as the system administrator, computer science is a good option that fit into my requirements.

The technology industry is growing with a high pace and creating the growth and the opportunity for the students and the people who are working in this field. Computer science and technology creates the interest for the people who love problem-solving and understand the new concepts of the technologies that are coming in the market. Majorly the IT field jobs require skills and knowledge gained through an advanced degree in computer science or engineering.

Advanced computer science curricula thoroughly cover how networks and security protocols work while system protocols work using the appropriate mathematical concepts and programming skills.

Computer engineers generally have the understanding of:

- A complete understanding of the computer architecture and hardware.
- Knowledge of designing and coding and testing the software.
- Flexible enough to work with wide range of software depending upon the company or the industry.

Computer scientists typically have an understanding of:

- How computer networks work and managing skills.
- Programming languages such as Java, Python, SQL and much more.
- Data structure and algorithms.

The computer scientists and engineers are both in demands in the field of A.I. Computer science focuses on troubleshooting issues on the software level. Learn different programming languages, how to maintain databases and understanding the working of operating systems.

Computer engineering focuses on solving problems and designing hardware and the software interfaces. Creates many options for the future offering employment in MNC's, software development companies, computer hardware and system design, can go for the post-graduation in the subject.

Computer Science and Engineering offers the rich variety and productive options when we talk about the IT sector and the technologies that are evolving nowadays with a greater chance of improvement, innovation and creativity.
