E-mails are the modern way of connecting with people. Time has changed and every person here is having the accounts to get connected with their people on personal as well as professional level. E-mails are common nowadays like getting letters in the early time.

Is every e-mail you get is secure? Do we protect our personal data from the hackers or the attackers? Can we identify the genuine mails? Many questions in a row that we should ask ourselves this year while dealing with e-mails.

As the use of e-mails are increasing to exchange information attackers are also increasing with their tricks and tracks to steal your information such as your bank account details, your passwords this may also include more sensitive information.

It's a high time to follow some basic rules to avoid such incidents .

- Always check the sender e-mail address if it seems correct then only open the mail.
- Never click on the malicious links given in the email this may take you to some other page where you can lose your confidentiality.
- Never share your details in the emails that state some urgency. For example: Send your bank account details on the urgent basics. This statement reflects urgency and ask you for the bank account number.
- Always check for the subject line of the e-mails.
- Read the content of the e-mails and then respond accordingly.

- Never share your passwords or usernames in the e-mails when asked by the unknown sender.

These are some basics and strong rules that one must follow to safeguard oneself from the attackers and their malicious and suspicious acts. Remember how much you are aware will reflect and improves your work quality.

E-mails are far easy way to communicate but it's the responsibility of an individual to use it safely and wisely. Let's keep ourselves safe from the attackers this year.

Phishing attacks are common that tries to steal your money, your personal details etc. but be smart to differentiate between attacks and communication.
