Now days, focus is shifted mainly on how to write a good scientific article without any obstacles. It can be accomplished once the author has a complete idea about the topic by finding the sufficient material from the original data or source. After understanding completely, the author can pen onto paper about his views in a simple, clear, and common English expressions [1].

Have a second look at the manuscript and see to that there are no repeated words or sentences. Always keep a check on the average length of the sentences in paragraph should not exceed more than three lines or strictly not cross more than 30 words. This will allow the author to tell his views in very short and brief manner, so that the article will always understandable to the readers [1].

Representing someone else's work or ideas or words without giving proper credit to the original author leads to plagiarism. To avoid this problem, one should make use of all the available data and get a grip on the topic chosen. This will allow the author not to use same phrases from the original source [2].

Always cite the information and mention the source from where it is actually taken from. The author should be thorough enough in the written or prepared manuscript and it should be easily understandable. Most important thing before submitting the manuscript to journal office is to read and correct the manuscript at least two or three times. This will avoid the duplication of the text which is exactly copied from the original article [2].

The author should also use plagiarism detection tools, which helps in screening the manuscript for data which is exactly similar. If this screening is missed at this stage, reviewers or the editor should check the data sent by author by using powerful plagiarism detection software like eTBLASt, Viper, Safe Assign, Wcopy Find, <http://www.checkforplagiarism.net>, <http://www.grammarly.com>, Duplichecker, PlagTracker, Plag Scan, Duplichecker etc [3].

In order to increase the quality in research, the author should avoid copy-paste of the original data, avoid improper citation, do not use the work of others, do not use the work or ideas of post graduate students as their own work, follow the sequence in listing authors according to the amount of their contribution towards the study. Patch work or using same words with little corrections here and there should be avoided, do not repeat one's own work again and again [3,4].

By following the above simple steps, one can avoid repeated or redundant publications. Thus, we can allow or improve the quality in research writing.
