We are very delighted to introduce our research work in Acta Scientific Gastrointestinal Disorders, second edition. An important plant which was selected for our research used in Mongolian traditional medicine of thousands years of history.

We studied chemistry and pharmaceuticals of the plant and carried out pharmacology trials using modern technology. After 20 years of work the new drug "Lonal" was born.

We are very excited to publish the article "The result of clinical trial for the new Lonal drug for hepatoprotective effect in patient with drug induced steatosis: A randomized placebo-controlled double blind clinical trial" in Acta Scientific Gastrointestinal Disorders second edition. We are glad that through your journal we can introduce how we were able to get good results in our clinical trials with Lonal, how we used laboratory, instrumental and scientific analyzes.

We would like to mention that it was very time-consuming to obtain the results of the live specimen from liver tissue.

However, we believe that research methods, clinical variants, and results will be scientifically valuable to researchers, hepatologists and gastroenterologists.

Researchers also note that research results are a valuable tool for science to solve the problems of society.

We are grateful to the editorial board of the journal for reviewing and publishing our article, thank you for your kind collaboration.

Looking forward for your comments and ideas after publishing of our article in in Acta Scientific Gastrointestinal Disorders second edition.
