Aims

To improve the In-patient Spasticity services at CERU (Cen Unit), UK.

We do inject our patients with Botulinum Toxin for their spastic limbs following their neurological illness, (e.g., following Multiple Sclerosis other neurological illnesses). To improve the multidisciplinary team and to improve the functional our management, now we developed a multidisciplinary approach includes them being seen in the ward round by the multidisciplinary team for their spasticity together and make a management their goals in mind. We designed a Performa for each patient's management to be filled via MDT approach and be reviewed.

Method

We developed a multidisciplinary approach for these patients being seen in the ward round by the multidisciplinary team spasticity together and make a management plan according mind. We designed a Performa for each patient who needs filled via MDT approach and be reviewed accordingly.

The timescale for this project was from October 2015 to Ja audit to make sure we achieved the goals and made the se implemented accordingly.

Results

This service development plan improved our patients' man as was measured through feedback and an audit. The multiple the spasticity management showed an improvement in our management with a better review plan in place as well with communication.

Conclusion

This altered muscle tone assessment and Evaluation clearly multidisciplinary approach as per Guidelines for the spastic the outcome of the management of spasticity in patients brain Injury.
