Lid hematoma enophthalmos supratarsal retraction limitations of movements in upwards and downward gaze diplopia.

Dullness of sensation in infraorbital region infraorbital nerve.

Blow out orbital fracture is a kind of disorder which is characterized by an increase in the intraorbital pressure as a result of injury by a closed fist cricket or hockey ball or rt accident.

Fracture lies 1 to 3 mm medial to the post part of infraorbital groove because medial wall of orbit is the weakest we can confirm the fracture by CT scan orbits or x-rays orbits.

We get reintegration and fragmentation of bone spicule.

Soft tissue swelling characterized by periorbital odema.

Partial haziness of maxillary sinus.

Complete haziness or obliteration of maxillary sinus

Presentation of patient

- Swelling and laceration if tissues around orbit.
- Lid hematoma.
- Sc hemarghe.

Ptosis enophthalmos supratarsal retraction limitations of movements in upwards and downward gaze diplopia in upward and downward gaze dullness of sensations on infraorbital region due to involvement of infraorbital nerve hypHEMA.

Management of blow out orbital fracture is by the team work of ophthalmologist:

- Plastic surgery
- ENT consultant.

Discussion

Blow out orbital fracture is a complex problem resulting from an increase in infraorbital pressure as result of blow by closed fist cricket or hockey ball or rt a since medial wall of orbit is the weakest so bo of lies 1 to 3 mm media to post part of infraorbital groove.

Management is by the combined team work of ophthalmologist:

- Ent consultant
- Plastic surgery.
