In this paper, we show how Alzheimer's Disease is caused by caffeine in combination with the Cystic Fibrosis gene (Protein) They also leads to Migraines and Gallstones.

Keywords: Cystic Fibrosis; Alzheimer's Disease; Migraines; Caffeine; Gallstones

Introduction

In this brief paper, we show how caffeine is the cause pf Alzheimer's Disease in some patients; those with the CF gene. We also show how migraines and gallstones are related to AD.

We have shown in a previous paper [1] that migraines are caused calcium salts (CaSO_4). Calcium Salts lead to gallstones. The root cause of migraines in some patients at east, is Cystic Fibrosis (CF). CF is a genetically inherited disease that causes problems with digestion and breathing. These are caused by a protein that causes stick excretions by the body. People with CF have difficulty digesting fats and proteins and may be under weight as a result. They experience severe headaches, nausea, vomiting, light sensitivity, and dizziness among other symptoms. CF is caused by a deficient protein. CF patients also may develop Alzheimer's Disease. AD is caused by another protein Beta Amyloid.

So the linkage is

CF (Genetic) + Caffeine → Hemiplegic Migraines (Genetic) from Calcium Salts → Gallstones → Low Serotonin and AD.

CF is inherited and affect many organs. It causes changes in the electrolyte transport system causing cells to absorb too much sodium and water [2].

This chemical mole balance is the common link between Cancer, Alzheimer's disease, and Down's Syndrome.

Conclusion

Caffeine and the Cystic Fibrosis protein combined with Calcium Salts may be the cause of Alzheimer's Disease in some patients.
