Early childhood is a critical period in development as quick improvements in bodily, mental, and socioemotional domains constitute the so called a building blocks of children's later growth. Health is the A country is not the mountains or plateaus that we live on as palace form continuous existence. Rather it is a collection of people who are living on the earthen. These people are rooted from children which are brought up healthy. Leaders, teachers, priests, philosophers, farmers, merchants, families, writers, and scientists are all the result from children grown into these nomenclatures. Children health is the key factor where the global concern should fail on. Most of the time children health is the critically considered point. In the globe, many researches stated that early childhood death is critical.

The health centers are not providing paper children treatment when they get foreign debases. Particularly, African countries are the most prominent content in mistreating the children when they get sick. Especially, when I consider my country Ethiopia from Africa, the health centers are very limited to accommodate the types of death arising in the country and few available centers to control death from the early childhood. The nurses, doctors and the people in the countries are very limited. The country in particular,

supported by farming and more population are farmer. The one that is exposed to different types of deaths are the farmer's family children. They are exposed to numbers of killer's debases such as malaria, ameba, tape work, communicable and no communicable diseases.

Thus, these are arising from the unclean water, food and shelter. They are exposed to contaminated food and drinking water. Therefore it is very essential to reconsiders the health of the people.
