Abstract

For the last several decades, research conducted by “frontier scientists” all over the world confirmed the reality of “energy” unknown to the modern science that ancients called “chi” (in China), “prana” (in India), “life force,” etc. A technological approach in harnessing this energy opens new possibilities for the rigorous scientific research of subtle energy. In this article, results of the effects of the technologically created energy patterns² on the survival rate of cells in the culture subjected to the gamma radiation presented³. It is shown that irradiated cells placed in the media processed with energy patterns specifically developed for cell rejuvenation increased the cell survival rate from an expected 50% to about 88%³. The observed healing effect was dramatically different when conducted in “energetically clean” versus “energetically dirty” environment. Special technologically created “protective” and “cleansing” energies were able to increase significantly healing effects in the polluted environment. This suggests a new method for improving the effectiveness of various healing modalities.

Keywords: Pollution; Energy; Healing

Introduction

Nowadays, everybody knows pathogenic bacteria are an actual cause of many diseases. However, not many people realize 200 years had passed between the discovery of the existence of microorganisms in the 1670's by Anton van Leeuwenhoek⁴ (who suggested they can be a cause of disease), and the universal recognition of this fact by the medical community. This widespread acceptance happened in the 1870s, when Joseph Lister developed practical methods for the sanitation of healthcare facilities. You

probably know that the researchers, Louis Pasteur and Robert Koch, were who finally persuaded medical science that microorganisms could be a cause of disease and the reason some diseases could be contagious. It needs to be said that during the 200 years between the discovery of Leeuwenhoek and the research of Pasteur-Koch, several scientists, among them Richard Bradley⁵ in the 1720s and Agostino Bassi⁶ in the 1810s, presented serious experimental proof of van Leeuwenhoek's supposition, but the medical community remained deaf to their voices.

1. The present article is based on the experimental data presented by Dr. Joie Jones and Dr. Yury Kronn at the Medical Week in Baden-Baden, October 2008. [6]

3. Jones J., Kronn Y. New Understandings on the Effects of Energetic Pollution on the Healing Process And Solutions Made Possible with Modern Subtle Energy Technology. Medical Week, Baden-Baden, October 2008.
4. Dobell, Clifford (1960) [1932]. Antony van Leeuwenhoek and His "Little Animals": being some account of the father of protozoology and bacteriology and his multifarious discoveries in these disciplines (Dover Publications ed.). New York: Harcourt, Brace and CoRicard.
5. Richard Bradley's most lasting work may be in the study of infectious disease. When many scientists were still holding fast to the ideals of mechanical philosophy, Bradley turned to empirical studies and experiments for his work. Though spread across a handful of his papers, when taken together, a unified, biological theory of infectious diseases spanning all life – from plants and animals to humans – emerges. [https://en.wikipedia.org/wiki/Richard_Bradley_\(botanist\)#cite_note-6](https://en.wikipedia.org/wiki/Richard_Bradley_(botanist)#cite_note-6)
6. The Italian Agostino Bassi was the first person to prove that a disease was caused by a microorganism when he conducted a series of experiments between 1808 and 1813, demonstrating that a "vegetable parasite" caused a disease in silkworms known as calcinaccio—this disease was devastating the French silk industry at the time. The "vegetable parasite" is now known to be a fungus pathogenic to insects called *Beauveria bassiana* (named after Bassi). https://en.wikipedia.org/wiki/Germ_theory_of_disease.

This story is a very good example of the many cases that show how rigid dominating scientific paradigms can be.

Now, we are facing a new discovery, quite likely an even more significant phenomenon that must be considered if we want to expand our understanding of how environmental conditions can influence our health, the success or failure of various healing modalities, and even be a cause of diseases. However, we need to pay great attention to this phenomenon, for it is even more invisible than the harmful microorganisms that needed the invention of the microscope to be discovered and observed. I am talking here about the universal phenomenon our frontier science calls “subtle energy” and which the ancients called the “vital force”.

For the last several decades, frontier scientists have conducted extensive research in an area of “energy” unknown to and/or ignored by modern science. The energy that frontier science currently calls “subtle energy” directly refers to what ancient researchers called “chi” (in China), “prana” (in India), and “life force”, a term used by many philosophers and scientists throughout the ages [1]. Two comprehensive books about subtle energy [1,2] present an enormous amount of experimental results from all over the world, providing evidence that this energy influences even the fundamental forces of the universe and affects the human well-being.

While the majority of the frontier research on this subtle energy has been directed toward its being harnessed and used for the benefit of human beings, it was recently discovered that this subtle energy can have positive or negative effects.

Experiments on changing the survival rate of the radiated cells under the influence of “pranic healers”

It is with this understanding that the extensive research of Professor Joie Jones (1941-2013) becomes highly relevant. Working at the University of California, Irvine in the mid-1990's, Dr. Jones began a long-term study to critically evaluate the effectiveness of the healing technique called “pranic healing.” For more than a decade, Dr. Jones spent his time in a laboratory setting using rigorous mainstream scientific methods investigating possible mediation effects of pranic healing on human cells that had been subjected to gamma radiation [3,4]. He chose human HeLa cells [5] for the study, since radiation survival rates are well-known for such cells and this particular laboratory model is well-established for radiation effects studies [6].

For those who are not familiar with the term “pranic healing,” we quote here Dr. Jones' explanation of the term given in his report at the Seventh World Pranic Healers' Convention (Mumbai, India,

May 12-14, 2006):

“Pranic healing is a so-called biofield therapy established in China thousands of years ago, but rediscovered and reformulated in recent times by Master Mei Ling (6th Century AD) and Master Choa Kok Sui (20th Century AD). Pranic healing is a type of ‘subtle energy’ medicine in which the practitioners believe they are able to tap into what is termed ‘prana’ or ‘chi,’ the ‘universal force’ or ‘life force,’ and to use this ‘energy’ to promote or enhance healing. Here ‘energy’ is used metaphorically for processes we do not fully understand that seem to involve interactions above and beyond conventional energy”.

The goal of the pranic healers involved in Dr. Jones' study was to alter the effects of radiation and enhance the survival rates of the cells. In his presentation to the Convention, he described the outcome of his experiment in the following way:

“In 520 experiments using 10 different pranic healers, typical survival rates increased from an expected 50% for untreated cells to over 90% for cells treated both before and after radiation. The distance between the healer and the cells proved unimportant. Shielding the cells and the healer from electromagnetic radiation, including gamma rays, had no effect on the results. Four experiments involving groups of pranic healers suggest that group healing enhances the desired effect”.

This research conducted by Dr. Jones is among the first to demonstrate the capability of subtle energy/“chi” to reverse the detrimental physical damage to human cells. It also demonstrated the ability of the human mind to “program” subtle energy actions (see also [2,7]).

However, another significant, yet certainly provocative observation was made by Dr. Jones during the course of his study. He found the healing effects produced by the pranic healers was dramatically different when conducted in “energetically clean” versus “energetically dirty” environments [6]. That is, Dr. Jones performed his experiments in three distinctly different laboratories and found with three distinctly different results [6]:

1. The “conditioned” lab: a laboratory that had been regularly “cleaned” by pranic healers (the “cleaning” referred to here is a special procedure these healers commonly used for energetic cleaning of the environment before each session).
2. The “non-conditioned” lab: a fairly new and well-maintained research environment.
3. The “dirty lab”: a laboratory where experiments on dissected animals and other similar experimentation had been conducted for years.

Here are the results Dr. Jones observed in these three laboratories:

	“Conditioned lab”	“Non-conditioned lab”	“Dirty lab”
Success Rate	88% (T = 854)	10% (T = 150)	0% (T = 150)

Table 1: Percentage of successful experiments in different labs.

Success rate = the number of petri dishes with an increased survival rate.

T = total number of experiments (at the moment of presentation in Baden-Baden [6])

Obviously, the success rate of the “conditioned” lab (i.e., “cleaned” by pranic healers) indicates the profound difference such “energetic cleaning” makes. What is particularly noteworthy here is that Dr. Jones’ experiments are the first scientific research with human cells that clearly demonstrate the damaging impact of energetic pollution on the healing process.

It is logical to assume that the human body itself, with its many varieties of cell types, is also sensitive to energetic conditions in the environment—when a person spends time in an environment that’s energetically “dirty” (e.g., due to the presence of the chaotic energy originating from various technological or environmental processes or residuals from suffering or interpersonal conflict), there will tend to be a weakening effect on that person’s health and well-being, and viceversa (one’s health and well-being will likely be more robust when one inhabits an energetically “clean” environment) [6].

Similarly, if this is true, we can expect to see negative influences of energetic pollution on any healing modality or procedure, that is, a diminishing and/or slowing down of its effectiveness. What we can see emerging from the results of Dr. Jones’ experiments are some important questions—with huge implications—in all areas of the science of health. It is very possible, medical clinics, surgical rooms, emergency rooms, psychiatric hospitals, etc., contain energetic pollution— in that they all have, “energetically” speaking, something in common with that “dirty lab” where Dr. Jones conducted his experiments [6].

Acknowledging the presence of energetic pollution in such environments gives rise to two questions: 1) Is it possible to counteract the negative impact of energetic pollution on the healing process? and 2) Is there any way to clean an energetically polluted environment?

Vital Force Technology: Experiments on changing the survival rate of the cells using subtle energy patterns

When we first met with Dr. Jones in 2001 at the Society for Scientific Exploration conference in La Jolla, California, we discussed these very questions. To begin to answer them, we suggested that we set up a series of experiments using the technologically generated subtle energy patterns we’d developed using a technology we had invented and refined over the course of the last 25 years. We call it Vital Force Technology (VFT)⁷. VFT is a three-part process comprised of a tunable plasma based generator that is able to generate and formulate subtle energy patterns; a storage system; and an infusing system that can infuse these subtle energy patterns into almost any substance. The most significant features of VFT, which distinguish it from all other subtle energy technologies, are its tunable generator and the ability to do the following:

1. Generate the energetic blueprints of any of the periodic table elements, which are the building blocks of all substances in the physical world. VFT makes it possible to utilize the unique healing properties of periodic table elements, while bypassing the side effects produced by their manmade chemical counterparts. For example, the energetic pattern of lithium is effective against depression; germanium supports the immune system, etc. [8].
2. Reproduce with precision the energetic blueprints of any substance and infuse these energetic blueprints into other (carrier) substances. This ability makes it possible to influence a property of any substance by infusing into this substance energetic imprints derived from rare or expensive materials, such as rare herbs, essential oils or expensive precious stones [8].
3. Produce subtle energy patterns with controllable properties defined by Traditional Chinese Medicine, such as the interaction of various energies, based on the principle of “The Five Elements” – Wood, Fire, Earth, Metal and Water. As a result, VFT has created complex energetic formulas following the time-tested rules used in Traditional Chinese Medicine, for example, energy-infused topicals to influence the acupuncture meridians without needles (non-invasive acupuncture) [8].

Over the course of working with Vital Force Technology™, a unique and extensive library of subtle energy patterns has been created. Many of these patterns have been experimentally tested using rigorous scientific methodologies and verified through practical use in the healthcare industry, on animals, plants [9], *in-vitro*

7. You can find description of the VFT and research using it at: www.vitalforcetechnology.com

cells [10] and gene activity [11]. Scientific equipment used in testing the subtle energy patterns produced by VFT include magnetic resonance imaging (MRI), heart rate variability [12] and gas discharge visualization devices [13], brain mapping, Raman spectroscopy [14], standard pharmaceutical tests on mice [15] and a wide variety of electroacupuncture tools.

Understanding the advantages of using technology in experiments with subtle energy (i.e., to support both repeatability and standardization of experimental conditions, not possible when human beings are used as a source of subtle energy), Dr. Jones decided to test energetic patterns developed with the help of VFT. After several years of periodically repeated tests of VFT energy patterns, he made the following statement:

"I first encountered Dr. Kronn and his Vital Force Technology (VFT) in 2001 and was intrigued by his concepts and the VFT energetic patterns. Since then I conducted a series of experiments with Vital Force formulas involving excitation of the Visual Cortex and the survival rates of HeLa cells subjected to gamma radiation. I found, using functional MRI, that when the acupoint BL67 was topically infused with a specific VFT formula excitation of the visual cortex occurred, similar to that produced by an acupuncture needle. These results suggest that the nature of subtle energy generated by VFT is similar to that of the energy referred to as "chi" in Traditional Chinese Medicine. Experiments with HeLa cells in culture subjected to gamma radiation showed that introducing cell compatible liquids (such as Ringer's Solution) infused with VFT formulas specifically developed for cell rejuvenation increased the cell survival rate from an expected 50% to about 88%. These experiments suggest that Vital Force Technology could produce profound effects on biological systems and has enormous potential... to provide a firm scientific basis for Subtle Energy research and reveals new ways of integrating ancient Eastern Medicine with Western science."

In his first experiments with the VFT energetic patterns' effect on HeLa cells damaged by Gamma radiation, Dr. Jones determined the energy pattern that provided the biggest increase of the survival rate of the cells (Figure 1).

You can see the VFT-generated energy pattern labeled "Formula 3" demonstrated the best result, in regard to enhancing the survival rate of human cells. We will refer to this as the "healing" (H) energy pattern.

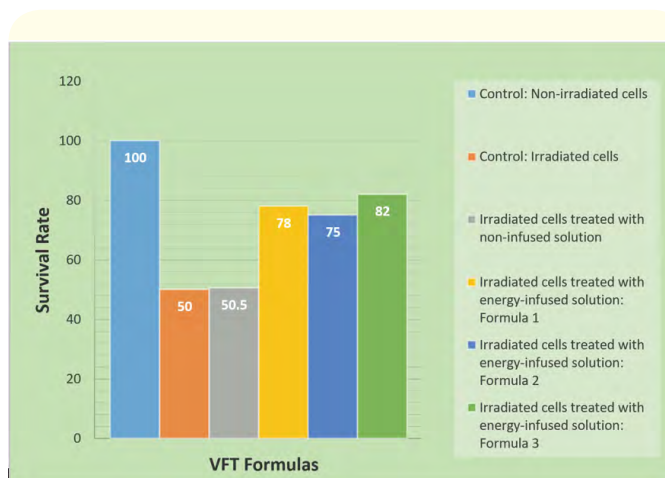

Figure 1: Comparison of VFT formulas' effect on survival rate of cells.

Once the most effective subtle energy pattern had been determined, we made a plan to move forward with and expand upon these findings. In 2006, we set up an experiment aimed at finding a way of counteracting the problem of "energetic pollution," in order to create conditions where the healing power of subtle energy could be demonstrated consistently and in any laboratory.

Additional goals of our experiments were to shed some light on the energetic mechanisms of the "power of intent" of the human mind.

For that, we decided to use the following approach: in the part of our experiments dealing with energetic pollution, energy patterns were produced by pranic healers and recorded with the help of VFT. The technique we used to record the subtle energy projected by the pranic healers is as follows: each pranic healer concentrated his or her "power of intent" for 10-15 minutes on a bottle of concentrated trace minerals⁸ solution in water. Then, energy patterns of this solution were copied using VFT.

In our experiments to determine whether energetic pollution could be counteracted by subtle energy patterns (whether generated by VFT or recorded from healers' intent), the patterns we used were infused into a Ringer solution and the solution was then added to petri dishes with HeLa cells growing in that solution. The same amount of "un-infused" Ringer solution was added to the control samples with radiated and non-radiated cells.

8. During many years of the experimentation with the VFT we discovered that trace minerals are very effective carriers of the subtle energy patterns infused into them. "Shelf life" of these energy infused minerals lasted for years [16,17]. You can find description of the VFT and research using it at: www.vitalforcetechnology.com

Similar to what was found in the pranic healing experiments, the maximum increase in the survival rate of cells in “successful” petri dishes occurred when the subtle energy-infused solution was added both before and after the radiation of the cells (Figure 2).

Figure 2: Percentage of survival rate of cells infused with Healing (“H”) subtle energy pattern.

Just as it was found in the pranic experiments reported by Dr. Jones, the success rate (the number of petri dishes with an increased survival rate) in this study was very different in the “conditioned”, “non-conditioned” and “dirty” laboratories, (See definitions of lab conditions on p. 2,3 above.)

Now, we can see the tremendous impact the energetically polluted environment has on the experiments. The results in table 2 (below) show that energetic pollution literally obstructs the capability of the energy pattern-infused solution to increase the survival rate of cells subjected to gamma radiation, which was found in cleaner energetic environments. As you can see, this happened no matter how the “healing” energy was applied – by healers or whether it was infused technologically.

	Pranic Healing	“H” Energy Pattern
Conditioned lab	88%	89%
Non-Conditioned lab	10%	11%
“Dirty” lab	0%	0%

Table 2: Percentage of successful experiments with pranic healing and “H” energy pattern.

Total number of experiments in each lab: 45 (H Energy Patterns)

We need to mention that the average percentage of increase in the survival rate in successful experiments was practically the same in the “conditioned” and “non-conditioned” labs: 88.2% and 88.3%, but the number of successful experiments was dramatically different.

The first experimental attempt to counteract the effect of the energetic pollution

These results stimulated us to conduct additional experiments aimed at finding ways to protect the “healing action” of the subtle energy pattern infused into the Ringer solutions from being destroyed by energetic pollution. For this purpose, a new “protective” energy pattern (“P”) was produced, using an energetic pattern created by a pranic healer’s intent and recorded with the help of VFT. “The next 45 experiments were conducted in each of the same three labs. This time, the Ringer solution added to the experimental samples was infused with the P-pattern” [16,17], along with the healing subtle energy pattern (“H”). As can be seen in Table 3 (below), the presence of the “protective” energy pattern dramatically increased the number of successful experiments in both the “non-conditioned” and the “dirty” labs.

	Pranic Healing	“H” Energy Pattern	“H” & “P” Energy Patterns
Conditioned lab	88%	89%	89%
Non-Conditioned lab	10%	11%	87%
“Dirty” lab	0%	0%	78%

Table 3: Percentage of successful experiments.

Total number of experiments in each lab: 45 (H and P Energy Patterns)

Thus, adding the “protective” energy pattern made the average increase in the cell survival rate in successful experiments the same in all three labs and made the average overall increase in the cells’[16,17] survival rate in the “dirty” lab statistically significant (Table 4).

“Adding this “protective” pattern did not change the number of successful experiments in the “conditioned” lab, which is logical to expect, while significantly affecting the results observed in the two labs with the energetically polluted environments” [16,17].

The “energetic cleansing” of the environment and its effect on the experimental results

Having succeeded in creating a “protective” energy pattern, we made an attempt to create a “cleansing” pattern that would be able

	A/Non Infused solution	B/Non Infused Solution	C/Infused Solution
Conditioned lab	Control untreated	Control Radiation Treated	Treated before and after radiation
HP, average all (45)	99.7%	50.3%	82.9%
HP, average successful (40)	99.3%	50.4%	88.0%
HP average fail (5)	99.5%	50.7%	50.7%
Non-Conditioned lab			
HP, average all (45)	99.4%	50.1%	82.4%
HP, average successful (39)	99.5%	49.8%	88.1%
HP, average fail (6)	99.3%	50.3%	50.8%
"Dirty" lab			
HP, average all (45)	99.2%	50.3%	79.5%
HP, average successful (35)	99.1%	50.5%	88.0%
HP, average fail (10)	99.3%	50.1%	51.0%

Table 4: Survival rate of cells in three labs.

"HP" represents "H" energy pattern plus a protective ("P") energy pattern

to clean the entire space in the "dirty" lab. Utilizing the same protocol we used for the creation of the "protective" subtle energy pattern, we made a "cleansing" energetic pattern.

In our first experiments with the "cleansing" energy pattern, we used the following method for influencing the space with this energy pattern. The energy was recorded with the VFT equipment in a DVD-audio format using the highest possible resolution. We played this DVD for 20 minutes one time (no sound is produced and only the subtle energy of the "cleansing" pattern is emitted) and got the following results:

	"H" Pattern
Conditioned lab	89% (T = 30)
Non-Conditioned lab	87% (T = 30)
"Dirty" lab	68% (T = 30)

Table 5: Percentage of successful experiments after treatment of laboratory spaces with "cleansing" energy pattern.

T = total number of experiments

It should be noted that when Dr. Jones' lab was being prepared for experiments the first time, it took pranic healers four months to condition the lab, and an increase in the survival rate of cells was never observed in the "dirty" lab. In our experiment, after 20 minutes of "energetic cleansing" of the lab space, we observed an increase of successful experiments in the "dirty" lab from 0% to 68%.

In order to determine how long the energetic cleansing is effective, Dr. Jones repeated the experiments with radiated cells in all three labs at intervals of three days, from the time of the original cleansing. Figure 3 (below) presents what was found.

Figure 3: Changes of the survival rate of cells with time measured in different labs.

In reviewing the data, one notices that the continued presence of energetic pollution in the "dirty" lab obstructs the healing energy much more than it does in the regular non-conditioned lab. More importantly, however, based on the experimentally-derived data cited here, we can answer this article's titular question in the affirmative: using a technological approach to harnessing subtle energy, it's possible to develop specifically targeted subtle energy patterns counteracting the effects of energetic pollution on the healing process.

Given the results obtained from these studies, a spray infused with the "cleansing" subtle energy patterns ("H" and "P") was developed as a simpler means of application (in contrast to the sophisticated delivery system used in the experimental studies) to cleanse energetic pollution from a wide variety of spaces. The first clinical observations of the result of cleaning an "energetic" environment using the spray (aptly called "Clean Sweep") was made

by Dr. Jeffrey Marrongelle of Schuylkill BioNutritional Health Clinic in Pennsylvania. He reported that after spraying “Clean Sweep” around his patients, he observed positive changes in the autonomic nervous system response (ANS), which he measured using heart rate variability (HRV) testing.

In chronically ill people, who are typically overly sensitive to EM radiation, he observed a drop in elevated heart rate up to 20 beats per minute and a decrease in the sympathetic nervous system (SNS) response up to 1.5 deviations towards normal. Even in people with no chronic conditions, Dr. Marrongelle observed the spray had a calming effect on the SNS up to 1.5 deviations and improved a number of physical fitness parameters.

These results demonstrate the necessity for further research to see how cleansing an environment of energetic pollution will impact the results of various healing modalities. It should be mentioned here that positive clinical results have been reported over the past five years since this energy cleansing spray has been in use in the field—in physical spaces as widely varied as business offices, veterinarian hospitals and research labs in which animal experimentation is regularly performed—indicating its efficacy as an energetic pollution cleanser.

The findings of this research hold important implications for the study and practice of subtle energy medicine, as well as application in a wide range of facilities, including hospitals, hotels, industrial and manufacturing plants and factories.

Conclusions

1. Subtle energy can be programmed for specific purposes using technology, as well as by “intent” of the trained human mind.
2. The ability of liquid minerals (concentrated sea salt solution) to hold the healing, protecting and cleansing information encoded in subtle energy demonstrates the presence of an intricate and fundamental interaction between the subtle energy field and physical matter.
3. An energetically polluted environment significantly diminishes the healing effect of subtle energy.
4. Special “protective” and “cleansing” energies are able to dramatically increase healing effects. This suggests a new method for improving the effectiveness of various healing modalities.

In closing, we would like to acknowledge the profound contribution of Dr. Joie Jones—to whom this article is dedicated—toward the development of this new understanding of the environmental effects of subtle energy on the healing process. We believe future medical science will be comparing Dr. Jones’ discoveries with Louis Pasteur’s discovery of the role of germs and microbes in the causes and prevention of disease, which revolutionized health care science in the nineteenth century.
