Keywords: HIV; AIDS; Drugs; Infection; Epidemic; Population; Death; Mathematics; Cybernetics; Life

BOOK I: Treatment of HIV infection

Book I proposes a method of treating HIV infection by means of precision setting of the immune system targeted by iterative calculations. Model analysis indicates the possibility of multiple increase of the life expectancy of HIV-infected patients by cybernetic methods.

BOOK II: War the AIDS epidemic

Book II examines scenarios for the development of the AIDS epidemic, the prediction of its disastrous consequences. Built the theory of the epidemic, and suggests practical measures for the relief and elimination of the epidemic.

Messages to American colleagues, UN, and Nobel Committee.

This Russian scientific Monograph continues basic research by American scientists [1,2], and contains an overview of the content in English.

Monograph confirms the negative forecast for the treatment of HIV by means of medicine and biology. The catastrophic development of the AIDS epidemic is predicted, aggravated by the development of the epidemic of drug addiction.

Monograph presents a new biological method of treatment, unknown to medical practice and biological theories, independently found by the artificial intelligence of our computer as a result of experiments with the American mathematical model of HIV. Experiments on the American mathematical model have shown that this discovery can significantly extend the life of HIV patients.

Monograph can serve as a textbook of cybernetics and a guide to the use of mathematics in medical and biological research for students of all specialties [3-7].
