As you know an estimated 3,800 tigers remain in the wild, but if we want to secure its species for future in the world then we should protect them from many hunters and killers. In some areas, the tiger numbers are declining because of many reasons and problems likewise, killing of tigers, holding of tigers in the cages, in fighting, in games but specially they sellout their organs and products in black market.

Wild tiger organs trade is illegal even also any other wild animal throughout the world but there are many people whom are doing this in an illegal and selling out in a commercial way for the money and that's why we are losing the number of tigers day by day.

They are earning many tens thousands of dollars with tiger organs trade through killing by guns, hunted with guns, axes and wire snares. Tigers also killed by villagers and tribes as a purpose of predator control from the village, as you know in some villages they are saying surely to threaten and scared the people and livestock such as goat, sheeps, buffalo, cows etc.

Recent history tells us that tiger species will vanish if we will not look after them in the future. In the world two recognized species of tiger are present one is the (*Panthera tigris*) which is continental and the other one is Sunda (*Panthera tigris sondaica*). In 1920s to 1930s government gave the legal protection to the Javan Tiger (*Panthera tigris sondaica*) yet it was still decreasing in numbers. In 1976 the last Javan Tiger seen in wild habitat after that no one else.

Very huge loss and declines in large numbers throughout their remaining asian range with 41% since the 1970s over the past years alone. The decline of tiger's numbers is mainly due to habi-

tat loss, illegal wildlife organ trade, hold in cages and human/tiger conflicts. Six faces are uncertain in future and three subspecies have already disappeared and destroyed.

Wild tigers number are approximately 3,250 in the wild. Tiger parts (organs and products) are still traded on the black market across the world, but specially in Asia and among Asian communities elsewhere, despite domestic trades ban but some people are trading this continuously and selling their body parts and products in black market which is totally illegal and in this way we are losing the tiger's species.

In November 2010 government of remaining tiger range states agreed to work together to stop the rate of wild tigers which are disappearing. In 2022 Global Tiger Recovery Program fixed a goal to make a doubling tiger numbers throughout the world [1].
