animals separate from healthy animals. Complete cleaning of the animal habitat and disinfection by phenyl from time to time. So that the fly can control the mosquitoes and the mosquitoes. To remove the external parasites of animals from time to time, take a bath in cypermethrin water and keep the animal in the shade.

In many districts of Rajasthan, cases of infection of lumpy skin disease or lumpy skin disease have been reported. LSD or lumpy skin disease is a highly contagious disease of the khaskar cow, which does not affect other animals and humans. This disease is caused by viruses such as sheep smallpox and goat smallpox and most of the parasites such as mosquitoes are caused by the bites of flies and flies. This has resulted in decrease in feed intake, decrease in milk production, weight loss, miscarriage, infertility.

### Symptoms of the disease

High temperature 105-106°C. In this disease, hard raised nodules of up to 20 to 50 mm in diameter develop on the body of animals, especially on the skin around the animal's mouth, neck and genitals. If not treated in time, these nodules may burst, which can lead to secondary bacterial infections, they can also get worms in them in the future.

### Control and prevention of disease

Control of the movement of other people and animals in a veterinary store or animal dairy. Arrangements for keeping diseased
